## BENZIMIDAZOLONES AND ANALOGUES AND THEIR USE AS PROGESTERONE RECEPTOR LIGANDS

Field of the Invention

This invention relates to compounds which are agonists and antagonists of the  
5 progesterone receptor, their preparation and utility.

Background of the Invention

Intracellular receptors (IR) form a class of structurally related gene regulators known as "ligand dependent transcription factors" (R. M. Evans, *Science*, 240, 889, 10 1988). The steroid receptor family is a subset of the IR family, including progesterone receptor (PR), estrogen receptor (ER), androgen receptor (AR), glucocorticoid receptor (GR), and mineralocorticoid receptor (MR).

The natural hormone, or ligand, for the PR is the steroid progesterone, but synthetic compounds, such as medroxyprogesterone acetate or levonorgestrel, have 15 been made which also serve as ligands. Once a ligand is present in the fluid surrounding a cell, it passes through the membrane *via* passive diffusion, and binds to the IR to create a receptor/ligand complex. This complex binds to specific gene promoters present in the cell's DNA. Once bound to the DNA the complex modulates the production of mRNA and protein encoded by that gene.

20 A compound that binds to an IR and mimics the action of the natural hormone is termed an agonist, whilst a compound which inhibits the effect of the hormone is an antagonist.

PR agonists (natural and synthetic) are known to play an important role in the 25 health of women. PR agonists are used in birth control formulations, typically in the presence of an ER agonist. ER agonists are used to treat the symptoms of menopause, but have been associated with a proliferative effect on the uterus which can lead to an increased risk of uterine cancers. Co-administration of a PR agonist reduces/ablates that risk.

PR antagonists may also be used in contraception. In this context they may be administered alone (Ulmann, et al, *Ann. N.Y. Acad. Sci.*, **261**, 248, 1995), in combination with a PR agonist (Kekkonen, et al, *Fertility and Sterility*, **60**, 610, 1993) or in combination with a partial ER antagonist such as tamoxifen (WO 96/19997 A1

5 July 4, 1996).

PR antagonists may also be useful for the treatment of hormone dependent breast cancers (Horwitz, et al, *Horm. Cancer*, 283, pub: Birkhaeuser, Boston, Mass., ed. Vedeckis) as well as uterine and ovarian cancers. PR antagonists may also be useful for the treatment of non-malignant chronic conditions such as fibroids (Murphy, 10 et al, *J. Clin. Endo. Metab.*, **76**, 513, 1993) and endometriosis (Kettel, et al, *Fertility and Sterility*, **56**, 402, 1991).

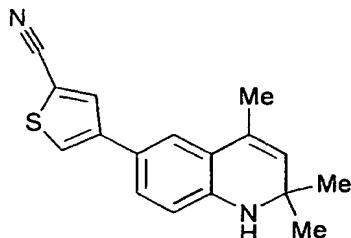

PR antagonists may also be useful in hormone replacement therapy for post menopausal patients in combination with a partial ER antagonist such as tamoxifen (U.S. Patent No. 5,719,136).

15 PR antagonists, such as mifepristone and onapristone, have been shown to be effective in a model of hormone dependent prostate cancer, which may indicate their utility in the treatment of this condition in men (Michna, et al, *Ann. N.Y. Acad. Sci.*, **761**, 224, 1995).

The compounds of this invention have been shown to act as competitive 20 inhibitors of progesterone binding to the PR and act as agonists and/or antagonists in functional models, either/or *in-vitro* and *in-vivo*. These compounds may be used for contraception, in the treatment of fibroids, endometriosis, breast, uterine, ovarian and prostate cancer, and post menopausal hormone replacement therapy.

- 16 -

Scheme I

As illustrated in Scheme I, the compounds of this invention are generally prepared by employing the suitable coupling reaction as a final step and further

5 converted to the thiourea analogues. Thus, appropriately protected  
 10 benzimidazolinones 1 (numerous protecting groups including but not limited to alkylloxycarbonyls, such as BOC group, can be employed in the starting material 1) readily prepared according to the procedure of Meanwell et al. (*J. Org. Chem.* 60, 1565-1582(1995) can be alkylating at position-3 under a number of conditions.

Among the reaction protocols, compound 1 can be alkylated by treatment of 1 with a suitable base such as sodium hydride in an appropriate nonprotic solvent such as DMF followed by addition of an alkylating agent such as alkyl iodide or triflate. Alternatively, the compound 2 can be effected employing a Mitsunobu protocol. The

conventional Mitsunobu reaction can couple the compound **1** with an appropriate alcohol using a phosphorous reagent such as triphenyl phosphine and a dehydrating agent such as DEAD (diethyl azodicarboxylate) in a suitable solvent such as THF at temperatures ranging from 0 °C to the boiling point of the solvent employed.

5 Deprotection of compound **2** to give **3** can be furnished *via* numerous conditions, such as acidic deprotection, using an acid such as neat trifluoroacetic acid or basic deprotection employing a base, such as sodium alkoxide in a suitable solvent, such as THF or alcohol at temperature ranging from ambient temperature to the boiling point of the solvent employed. The compounds of this invention, **4**, can be readily prepared

10 by employing various coupling reactions including Suzuki, Stille protocols. These reactions are commonly performed in the presence of transition metallic catalyst, e.g., palladium or nickel complex often with phosphino ligands, e.g., Ph<sub>3</sub>P, 1,1'-bis(diphenylphosphino)ferrocene, 1,2-bis(diphenylphosphino)ethane or a catalyst such as palladium acetate. Under this catalytic condition, an appropriately substituted

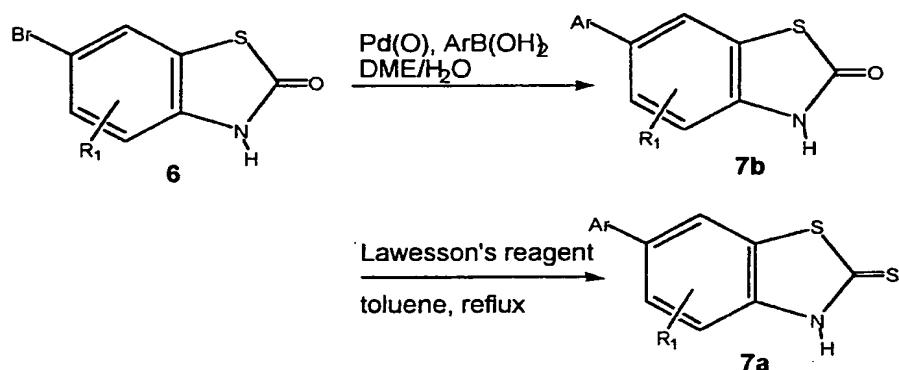

15 nucleophilic reagent, e.g., aryl boronic acid, arylstannane, or aryl zinc compound, is coupled with bromobenzimidazolines **3** to give compounds **4**. An appropriate base is often needed in the reaction; the commonly used bases include but are not limited to sodium bicarbonate, sodium carbonate, potassium phosphate, barium carbonate, cesium fluoride, or potassium acetate. The most commonly used solvents in these

20 reactions include benzene, DMF, isopropanol, ethanol, DME, ether, acetone or a mixture of above solvent and water. The coupling reaction is generally executed under an inert atmosphere such as nitrogen or argon at temperatures ranging from room temperature to 95 °C.

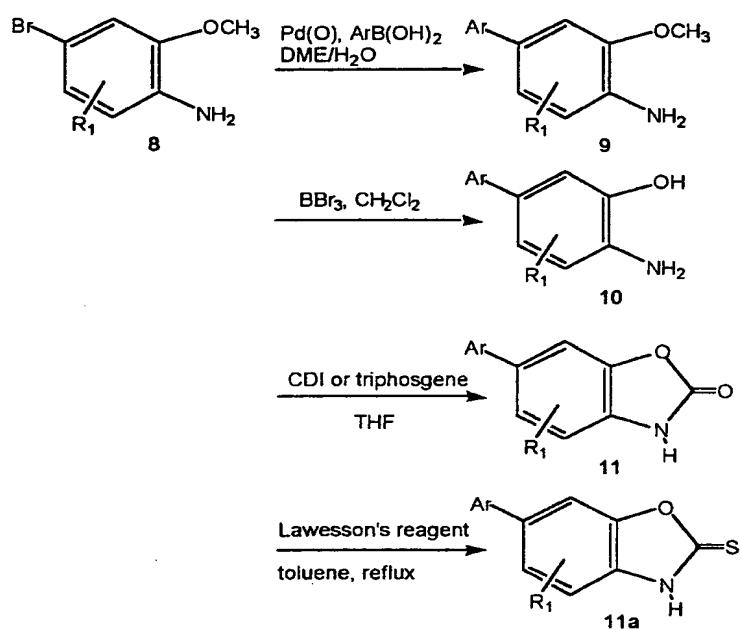

The compounds of this invention, **5**, can be easily prepared using an appropriate sulfur reagent such as Lawesson's reagent or P<sub>2</sub>S<sub>5</sub> in a suitable solvent such as toluene, xylene, chlorobenzene at reflux under an inert atmosphere such as nitrogen or argon.

Scheme III

As shown in scheme II, 5-aryl benzothiazolinones 7 can be readily prepared from an appropriate 5-bromo-benzothiazolinone 6 and a suitable electrophile such as aryl boronic acid, aryl tin reagent, or aryl zinc reagent *via* a suitable coupling reaction as described for the synthesis of benzimidazolinones 4. Conversion of 7b into 7a is 5 be effected using an appropriate sulfur reagent such as Lawesson's reagent or P<sub>2</sub>S<sub>5</sub> in a suitable solvent such as toluene, xylene, chlorobenzene at reflux under an inert atmosphere such as nitrogen or argon.

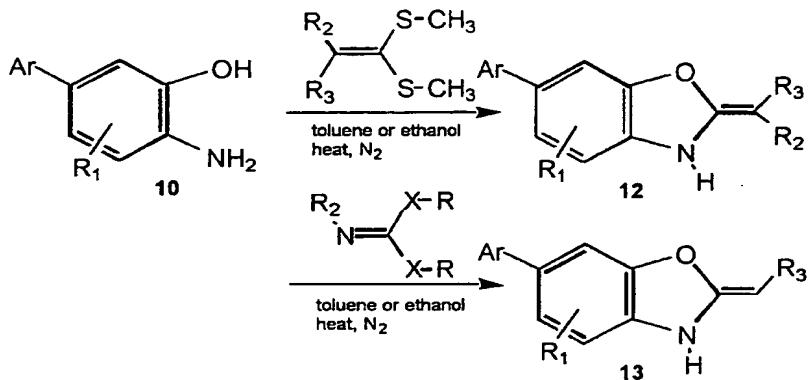

The synthetic approaches leading to the 5-aryl benzoxazolinones 11 is described in scheme III. As illustrated in scheme III, an appropriately substituted 10 bromo *o*-anisidine can be coupled with an appropriate electrophile such as aryl boronic acid or aryl tin reagent *via* a coupling reaction as described for the synthesis of compounds 4 to give the biaryl 9. Demethylation of biaryl 9 to give amino phenol 10 can be accomplished *via* various conditions including treatment of 9 with a strong Lewis acid such as boron tribromide in a suitable solvent such as methylene chloride or 15 treatment of 9 with a mixture of a suitable Lewis acid such as aluminum chloride and a soft nucleophile such as thiol in a suitable solvent such as methylene chloride under an inert atmosphere such as argon or nitrogen. Ring closure of amino phenol 10 to produce the compounds of this invention, 11, can be effected by using a appropriate condensing agent such as carbonyldiimidazole, phosgene, dimethylcarbonate, or 20 diethylcarbonate in a suitable nonprotic solvent such as THF at temperatures ranging from room temperature to 65 °C. Conversion of 11 into 11a can be accomplished using an appropriate sulfur reagent such as Lawesson's reagent or P<sub>2</sub>S<sub>5</sub> in a suitable solvent such as toluene, xylene, chlorobenzene at reflux under an inert atmosphere such as nitrogen or argon.

25 Schemes IV, V, and VI describe the synthesis of other 5-aryl benzimidazolinone, 5-aryl benzothiazolinone, 5-aryl benzoxazolinone bioisosteres. Using a similar procedure reported by Kondo et al. (Kondo, et al. *J. Med. Chem.* 33(7), 2012-2015(1990)) compound 12, 15, or 18 can be effected by treatment of compound 10, 14, or 17 with an appropriate ketene-*S*, *S*-acetals (at least one of R<sub>2</sub> or

- 20 -

R<sub>3</sub> is an electron withdrawing group) in a suitable solvent such as toluene or anhydrous ethanol under an inert atmosphere such as nitrogen or argon at reflux. In a similar fashion, compounds 13, 16, or 19 can be prepared by reaction of compound 10, 14, or 17 with appropriate imino-S, S-acetals or imino-acetals (R<sub>2</sub> is an electron withdrawing group) employing a procedure similar to that of Evers, et al. (*I. Prakt. Chem.* 333(5), 699-710 (1991)) or Haake et al. (*Synthesis-Stuttgart* 9, 753-758 (1991)) in a suitable solvent such as ethanol under an inert atmosphere such as argon or nitrogen at reflux.

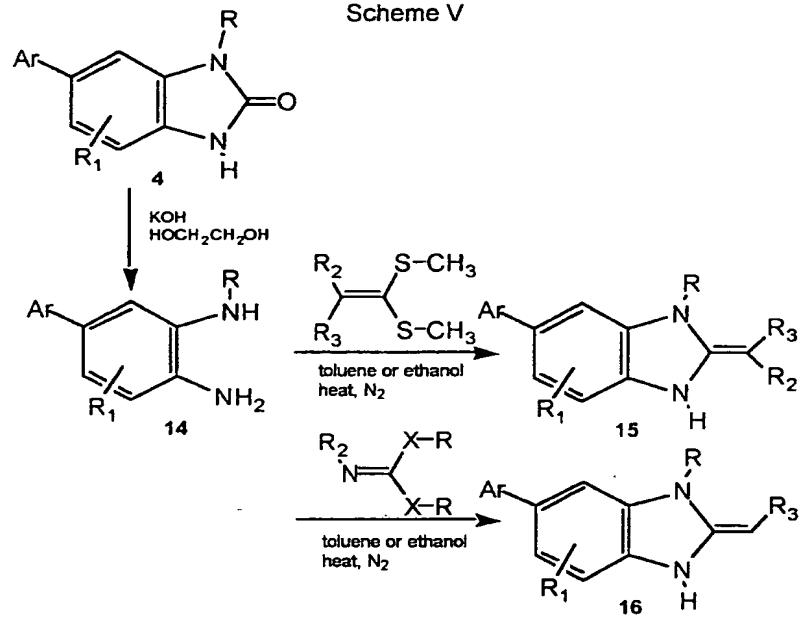

Scheme IV

10 Compounds 14 and 17 can be prepared as shown in schemes V and VI from compounds 4 and 7 using strong basic conditions such as heating the compound in a mixture of potassium hydroxide and ethylene glycol at 165 °C under an inert atmosphere such as argon or nitrogen.

Scheme V

- 22 -

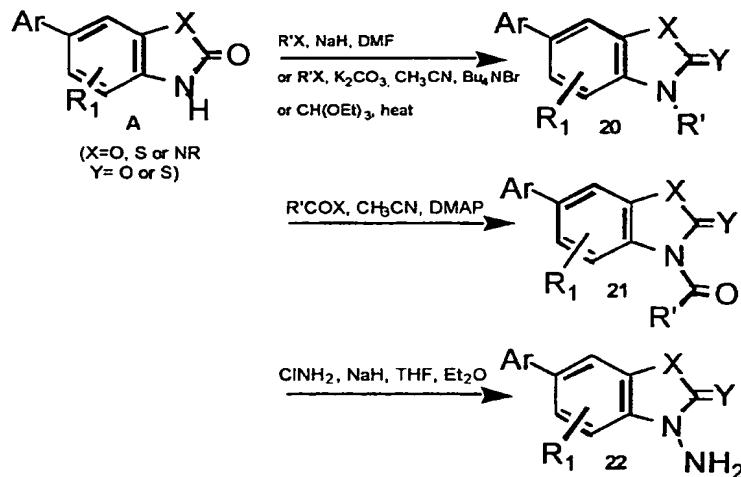

Scheme VI

As illustrated in scheme VII, the compounds of this invention can be further derivatized at position-1 *via* numerous approaches leading to a variety of the novel 5 compounds including 20, 21, and 22. Thus, alkyl or substituted alkyl derivatives 20 can be formed by treatment of compound A with a suitable base such as sodium hydride in suitable solvent such as DMF under an inert atmosphere such as argon or nitrogen followed by addition of an appropriate electrophile such as an alkyl or substituted alkyl bromide, iodide, or triflate. Such transformation of A at position-1 10 can also be effected using biphasic conditions as indicated in scheme VII in which alkylation is executed using a biphasic catalyst such as tributylammonium bromide in a suitable solvent such as acetonitrile. A further example of such modification includes but is not limited to the one depicted in scheme VIII via heating A with triethyl 15 orthoformate to afford 1-substituted derivatives 20.

- 23 -

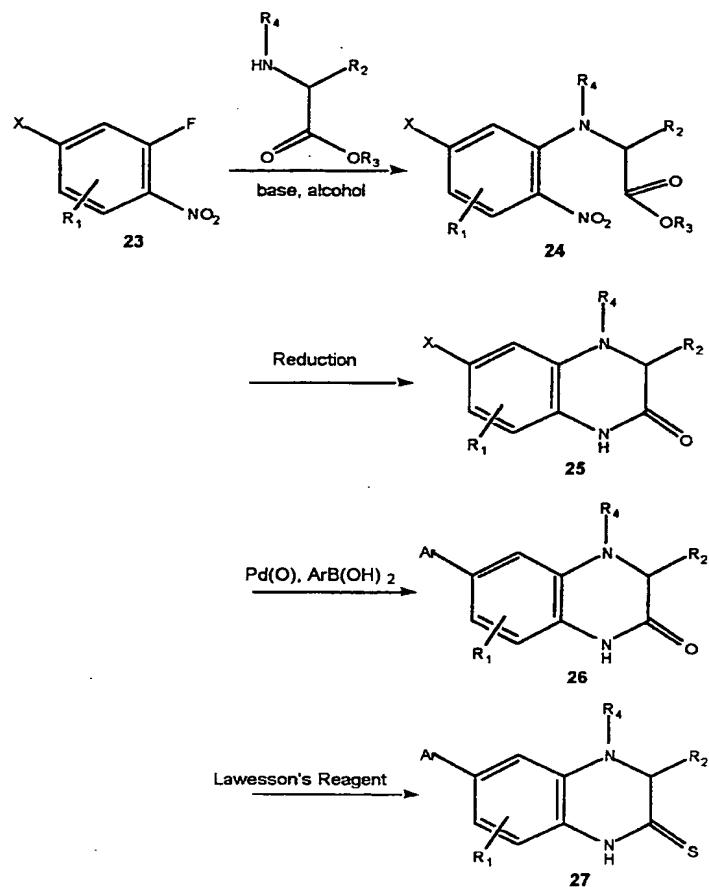

Scheme VII

The acylation or carboxylation of the compound A at position-1 to give compound 21 can be readily effected by treatment of A with a suitable acylating or 5 carboxylating reagent such as di-*t*-butyl dicarbonate in the presence of a suitable basic catalyst such as DMAP in a suitable solvent such as acetonitrile under an inert atmosphere such as argon or nitrogen. The amination of position-1 of compound A to give compound 22 can be furnished using a suitable aminating reagent such as chloroamine in the presence of a suitable base such as sodium hydride in a suitable 10 solvent such as THF or diethyl ether following the literature procedure (Metlesics et al. *J. Org. Chem.* 30, 1311(1965)).

- 24 -

Scheme XIII

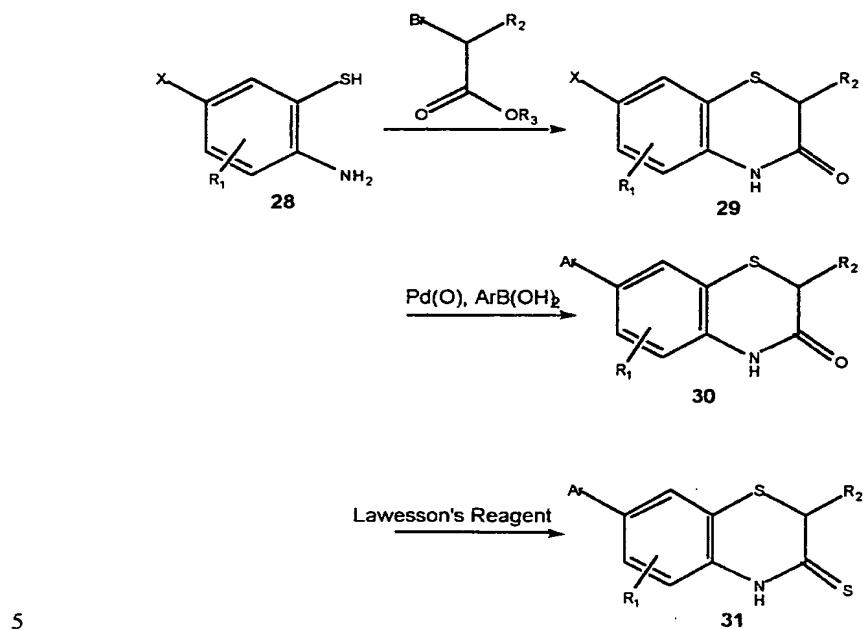

Scheme VIII describes a procedure to prepare quinoxalin-4-ones. An *o*-fluoro nitro-benzene 23 (X = I, Br, Cl) is reacted with an appropriate substituted amino acid derivative in the presence of a suitable base in a protic solvent such as alcohol to give compound 24 which is readily reduced by a suitable reducing agent such as tin chloride to furnish quinoxalin-2-one 25. The compounds of this invention, 26, can be easily

- 25 -

produced by coupling an appropriate aryl boronic acid with compound 25 in a similar fashion as for the preparation of compound 9. Conversion of 26 to 27 can be readily effected following the procedure of synthesizing compound 11a.

Scheme IX

5

Scheme IX illustrates an approach to prepare the benzothiazinones. Thus, a substituted *o*-amino benzenethiol 28 is treated with an appropriately substituted  $\alpha$ -bromoacetate in a suitable solvent such as ethanol to afford compound 29. Compound 10 29 can be readily coupled with an aryl boronic acid following the protocol of compound 9 to afford the compounds of this invention, 30. Conversion of 30 to 31

can be carried out using a suitable sulfur reagent such as Lawesson's reagent according to procedure of synthesized compounds 11a.

5 0.1 and 500 mg per day, or alternatively used in a different regimen which would entail 2-4 days of treatment with the progesterone receptor antagonist after 21 days of a progestin. In this regimen between 0.1 and 500 mg daily doses of the progestin (e.g. levonorgestrel, trimegestone, gestodene, norethistrone acetate, norgestimate or cyproterone acetate) would be followed by between 0.1 and 500 mg daily doses of the

10 progesterone receptor antagonists of the current invention.

Specific uses of the compounds and pharmaceutical compositions of invention include the treatment and/or prevention of uterine

15 myometrial fibroids, endometriosis, benign prostatic hypertrophy; carcinomas and adenocarcinomas of the endometrium, ovary, breast, colon, prostate, pituitary, meningioma and other hormone-dependent tumors. Additional uses of the present progesterone receptor antagonists include the synchronization of the estrus in livestock.

25 When used in contraception the progesterone receptor agonists of the current invention are preferably used in combination or sequentially with an estrogen agonist (e.g. ethinyl estradiol). The preferred dose of the progesterone receptor agonist is between 0.01 and 500 mg per day.

This invention also includes pharmaceutical compositions comprising one or more compounds described herein, preferably in combination with one or more pharmaceutically acceptable carriers or excipients. When the compounds are employed for the above utilities, they may be combined with one or more

5 pharmaceutical carriers or excipients, for example, solvents, diluents and the like, and may be administered orally in such forms as tablets, capsules, dispersible powders, granules, or suspensions containing, for example, from about 0.05 to 5% of suspending agent, syrups containing, for example, from about 10 to 50% of sugar, and elixirs containing, for example, from about 20 to 50% ethanol, and the like, or  
10 parenterally in the form of sterile injectable solutions or suspensions containing from about 0.05 to 5% suspending agent in an isotonic medium. Such pharmaceutical preparations may contain, for example, from about 25 to about 90% of the active ingredient in combination with the carrier, more usually between about 5% and 60% by weight.

15 The effective dosage of active ingredient employed may vary depending on the particular compound employed, the mode of administration and the severity of the condition being treated. However, in general, satisfactory results are obtained when the compounds of the invention are administered at a daily dosage of from about 0.5 to about 500 mg/kg of animal body weight, preferably given in divided doses two to four  
20 times a day, or in a sustained release form. For most large mammals, the total daily dosage is from about 1 to 100 mg, preferably from about 2 to 80 mg. Dosage forms suitable for internal use comprise from about 0.5 to 500 mg of the active compound in intimate admixture with a solid or liquid pharmaceutically acceptable carrier. This dosage regimen may be adjusted to provide the optimal therapeutic response. For  
25 example, several divided doses may be administered daily or the dose may be proportionally reduced as indicated by the exigencies of the therapeutic situation.

These active compounds may be administered orally as well as by intravenous, intramuscular, or subcutaneous routes. Solid carriers include starch, lactose, dicalcium phosphate, microcrystalline cellulose, sucrose and kaolin, while liquid carriers include

sterile water, polyethylene glycols, non-ionic surfactants and edible oils such as corn, peanut and sesame oils, as are appropriate to the nature of the active ingredient and the particular form of administration desired. Adjuvants customarily employed in the preparation of pharmaceutical compositions may be advantageously included, such as

5 flavoring agents, coloring agents, preserving agents, and antioxidants, for example, vitamin E, ascorbic acid, BHT and BHA.

The preferred pharmaceutical compositions from the standpoint of ease of preparation and administration are solid compositions, particularly tablets and hard-filled or liquid-filled capsules. Oral administration of the compounds is preferred.

10 These active compounds may also be administered parenterally or intraperitoneally. Solutions or suspensions of these active compounds as a free base or pharmacologically acceptable salt can be prepared in water suitably mixed with a surfactant such as hydroxypropylcellulose. Dispersions can also be prepared in glycerol, liquid, polyethylene glycols and mixtures thereof in oils. Under ordinary  
15 conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form must be sterile and  
20 must be fluid to the extent that easy syringe ability exists. It must be stable under conditions of manufacture and storage and must be preserved against the contaminating action of microorganisms such as bacterial and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol (e.g., glycerol, propylene glycol and liquid polyethylene glycol), suitable mixtures thereof,  
25 and vegetable oil.

The following non-limiting examples illustrate preparation and use of the compounds of the invention.

1. T47D cell proliferation assay

The objective of this assay is the determination of progestational and antiprogestational potency by using a cell proliferation assay in T47D cells. A compound's effect on DNA synthesis in T47D cells is measured. The 5 materials and methods used in this assay are as follows.

a. Growth medium: DMEM:F12 (1:1) (GIBCO, BRL) supplemented with 10% (v/v) fetal bovine serum (not heat-inactivated), 100U/ml penicillin, 100mg/ml streptomycin, and 2 mM GlutaMax (GIBCO, BRL).

10 b. Treatment medium: Minimum Essential Medium (MEM) (#51200-038 GIBCO, BRL) phenol red-free supplemented with 0.5% charcoal stripped fetal bovine serum, 100U/ml penicillin, 200 mg/ml streptomycin, and 2 mM GlutaMax (GIBCO, BRL).

c. Cell culture

15 Stock T47 D cells are maintained in growth medium. For BrdU incorporation assay, cells are plated in 96-well plates (Falcon, Becton Dickinson Labware) at 10,000 cells/well in growth medium. After overnight incubation, the medium is changed to treatment medium and cells are cultured for an additional 24 hr before treatment. Stock compounds are dissolved in appropriate vehicle (100% ethanol or 50% 20 ethanol/50% DMSO), subsequently diluted in treatment medium and added to the cells. Progestin and antiprogestin reference compounds are run in full dose-response curves. The final concentration of vehicle is 0.1%. In control wells, cells receive vehicle only. Antiprogestins are tested in the presence of 0.03 nM trimegestone, the reference progestin agonist. Twenty-four hours after treatment, the medium is 25 discarded and cells are labeled with 10 mM BrdU (Amersham Life Science, Arlington Heights, IL) in treatment medium for 4 hr.

d. Cell Proliferation Assay

At the end of BrdU labeling, the medium is removed and BrdU incorporation is measured using a cell proliferation ELISA kit (#RPN 250, Amersham

Life Science) according to manufacturer's instructions. Briefly, cells are fixed in an ethanol containing fixative for 30 min, followed by incubation in a blocking buffer for 30 min to reduce background. Peroxidase-labeled anti-BrdU antibody is added to the wells and incubated for 60 min. The cells are rinsed three times with PBS and 5 incubated with 3,3'5,5'-tetramethylbenzidine (TMB) substrate for 10-20 min depending upon the potency of tested compounds. Then 25  $\mu$ l of 1 M sulfuric acid is added to each well to stop color reaction and optical density is read in a plate reader at 450 nm within 5 min.

e. Analysis of Results:

10 Square root-transformed data are used for analysis of variance and nonlinear dose response curve fitting for both agonist and antagonist modes. Huber weighting is used to downweight the effects of outliers. EC<sub>50</sub> or IC<sub>50</sub> values are calculated from the retransformed values. JMP software (SAS Institute, Inc.) is used for both one-way analysis of variance and non-linear dose response analyses in both single dose and dose 15 response studies.

f. Reference Compounds:

Trimegestone and medroxyprogesterone acetate (MPA) are reference progestins and RU486 is the reference antiprogestin. All reference compounds are run in full dose-response curves and the EC<sub>50</sub> or IC<sub>50</sub> values are calculated.

2. Rat decidualization assay

15 The objective of this procedure is used to evaluate the effect of progestins and antiprogestins on rat uterine decidualization and compare the relative potencies of various test compounds. The materials and methods used in this assay are as follows.

20 a. Methods: Test compounds are dissolved in 100% ethanol and mixed with corn oil (vehicle). Stock solutions of the test compounds in oil (Mazola<sup>TM</sup>) are then prepared by heating (~80 °C) the mixture to evaporate ethanol. Test compounds are subsequently diluted with 100% corn oil or 10% ethanol in corn oil prior to the treatment of animals. No difference in decidual response was found when these two vehicles were compared.

25 b. Animals (RACUC protocol #5002)  
Ovariectomized mature female Sprague-Dawley rats (~60-day old and 230g) are obtained from Taconic (Taconic Farms, NY) following surgery. Ovariectomy is performed at least 10 days prior to treatment to reduce circulating sex steroids. Animals are housed under 12 hr light/dark cycle and given standard rat chow and water *ad libitum*.

- 50 -

c. Treatment

Rats are weighed and randomly assigned to groups of 4 or 5 before treatment. Test compounds in 0.2 ml vehicle are administered by subcutaneous injection in the nape of the neck or by gavage using 0.5 ml. The animals are treated once daily for seven days. For testing antiprogestins, animals are given the test compounds and a EC50 dose of progesterone (5.6 mg/kg) during the first three days of treatment. Following decidual stimulation, animals continue to receive progesterone until necropsy four days later.

10 d. Dosing

Doses are prepared based upon mg/kg mean group body weight. In all studies, a control group receiving vehicle is included. Determination of dose-response curves is carried out using doses with half log increases (e.g. 0.1, 0.3, 1.0, 3.0 mg/kg).

15 e. Decidual induction

Approximately 24 hr after the third injection, decidualization is induced in one of the uterine horns by scratching the antimesometrial luminal epithelium with a blunt 21 G needle. The contralateral horn is not scratched and serves as an unstimulated control. Approximately 24 hr following the final treatment, rats are 20 sacrificed by CO<sub>2</sub> asphyxiation and body weight measured. Uteri are removed and trimmed of fat. Decidualized (D-horn) and control (C-horn) uterine horns are weighed separately.

f. Analysis of Results:

The increase in weight of the decidualized uterine horn is 25 calculated by D-horn/C-horn and logarithmic transformation is used to maximize normality and homogeneity of variance. The Huber M-estimator is used to down weight the outlying transformed observations for both dose-response curve fitting and one-way analysis of variance. JMP software (SAS Institute, Inc.) is used for both one-way ANOVA and non-linear dose-response analyses.

g. Reference Compounds:

All progestin reference compounds were run in full dose-response curves and the EC<sub>50</sub> for uterine wet weight were calculated.

c. Cell Culture and Treatment:

Frozen T47D cells were thawed in a 37°C water bath and diluted to 280,000 cells/ml in culture medium. To each well in a 96-well plate (Falcon, Becton Dickinson Labware), 180  $\mu$ l of diluted cell suspension was added.

5 Twenty  $\mu$ l of reference or test compounds diluted in the culture medium was then added to each well. When testing for progestin antagonist activity, reference antiprogestins or test compounds were added in the presence of 1 nM progesterone. The cells were incubated at 37°C in a 5% CO<sub>2</sub>/humidified atmosphere for 24 hr.

d. Alkaline Phosphatase Enzyme Assay:

10 At the end of treatment, the medium was removed from the plate and fifty  $\mu$ l of assay buffer I was added to each well. The plates were shaken in a titer plate shaker for 15 min. Then 150  $\mu$ l of assay buffer II was added to each well. Optical density measurements were taken at 5 min intervals for 30 min at a test wavelength of 405 nM.

15 e. Analysis of Results: Analysis of dose-response data  
For reference and test compounds, a dose response curve is generated for dose (X-axis) vs. the rate of enzyme reaction (slope) (Y-axis). Square root-transformed data are used for analysis of variance and nonlinear dose response curve fitting for both agonist and antagonist modes. Huber weighting is used to 20 downweight the effects of outliers. EC<sub>50</sub> or IC<sub>50</sub> values are calculated from the retransformed values. JMP software (SAS Institute, Inc.) is used for both one-way analysis of variance and non-linear dose response analyses in both single dose and dose response studies.

f. Reference Compounds:

25 Progesterone and trimegestone are reference progestins and RU486 is the reference antiprogestin. All reference compounds are run in full dose response curves and the EC<sub>50</sub> or IC<sub>50</sub> values are calculated.

Continuation of Box I.2

Claims Nos.: 1, 28-30 (all partly)

The initial phase of the search revealed a very large number of documents relevant to the issue of novelty. So many documents were retrieved that it is impossible to determine which parts of the claim(s) may be said to define subject-matter for which protection might legitimately be sought (Article 6 PCT). For these reasons it appears impossible to execute a meaningful search and/or to issue a complete search report over the whole breadth of the above mentioned claim(s).

The search and the report for those claims can only be considered complete for the subject-matter of claims 2-27 and 31-34.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.

(54) Title: BENZIMIDAZOLONES AND ANALOGUES AND THEIR USE AS PROGESTERONE RECEPTOR LIGANDS

(57) Abstract: The present invention provides compounds and pharmaceutical formulations useful as progesterone receptor agonists and antagonists and having general formula (a): wherein A is O, S, or NR<sup>4</sup>; B is a bond between A and C=Q, or the moiety CR<sup>2</sup>R<sup>6</sup>; R<sup>4</sup>, R<sup>5</sup>, R<sup>6</sup> are independently selected from H or optionally substituted C<sub>1</sub> to C<sub>6</sub> alkyl, C<sub>2</sub> to C<sub>6</sub> alkenyl, C<sub>2</sub> to C<sub>6</sub> alkynyl, C<sub>3</sub> to C<sub>8</sub> cycloalkyl, substituted C<sub>3</sub> to C<sub>8</sub> cycloalkyl, aryl, or heterocyclic groups, or cyclic alkyl constructed by fusing R<sup>4</sup> and R<sup>5</sup> to form a 5 to 7 membered ring; R<sup>1</sup> is selected from H, OH, NH<sub>2</sub>, C<sub>1</sub> to C<sub>6</sub> alkyl, substituted C<sub>1</sub> to C<sub>6</sub> alkyl, C<sub>3</sub> to C<sub>6</sub> alkenyl, substituted C<sub>1</sub> to C<sub>6</sub> alkenyl, alkynyl, substituted alkynyl, -COH, or optionally substituted -CO(C<sub>1</sub> to C<sub>3</sub> alkyl), -CO(aryl), -CO(C<sub>1</sub> to C<sub>3</sub> alkoxy), or -CO(C<sub>1</sub> to C<sub>3</sub> aminoalkyl) groups; R<sup>2</sup> is selected from H, halogen, CN, NO<sub>2</sub>, or optionally substituted C<sub>1</sub> to C<sub>6</sub> alkyl, C<sub>1</sub> to C<sub>6</sub> alkoxy, or C<sub>1</sub> to C<sub>6</sub> aminoalkyl groups; R<sup>3</sup> is selected from a trisubstituted benzene ring; or a 5- or 6-membered heteroaromatic ring containing 1 or 2 substituents; Q is O, S, NR<sup>8</sup>, or CR<sup>9</sup>R<sup>10</sup>; or a pharmaceutically acceptable salt thereof. The invention also includes methods of contraception and methods of treating or preventing maladies associated with the progesterone receptor.
